Fashion Fancies

By Marie Belmont

Navy blue, which disappeared from the ranks of fashion almost entirely last Fall, promises to be one of the featured Fall colors this season.

The simple dress above is made of navy blue kasha. The deep V insert at the front of the frock serves to give added length and gracefulness to the figure.

DIET AND TEETH BY BARBARA BROOKS.

Home Economics Department, Kellogg Co. of Canada, Ltd., London, Canada.

A medical journal recently published an article on the effect of diet and sunshine on teeth. The conclusion from a survey of children's teeth confirms the theory that is associated with good teeth and a softer one with poor teeth. Water is also said to have its effect on dental conditions, hard water being beneficial to good development.

Foods which are recommended are bran and whole wheat breads, especially the crusts. The child of this generation is being told that crusts will build strong teeth rather than they will make the hair curl. Perhaps many of us have better teeth because we believed the latter story even though we never achieved the golden ringlets of our imagination pictured developing over night after having conscientiously consumed the crust of bread at supper.

Other foods which aid in tooth building are raw fruits and vegetables especially the fibrous sorts such as apples, cabbage and celery. These are effective cleansing agents and we hope the time will come when celery hearts or chopped cabbage will be served after the dessert course. How much better our mouths would feel than now when we end a meal with a soft sweet pudding, cake or cream pie.

Children should be served with whole grain cereals. The ready-to-eat breakfast foods are valuable because they need to be chewed, and chewing stimulates the teeth. Some mothers give their children these cereals dry as a between meal food as well as for breakfast served with milk.

Other factors in the building and protecting of teeth are milk, cod liver oil and sunshine. The milk is rich in lime, and cod liver oil and sunshine helps the body to utilize it. Of equal importance is the regular examination by a dentist so that the teeth will be kept thoroughly clean and any decay stopped in time.

anese crab meat.

From personal experience, I am convinced that in order to ensure permanent keeping qualities, lobsters must be processed in steam retorts. Two and one half to three hours in boiling water, even though a uniform temperature of 212 degrees is maintained throughout the entire process (which is rarely the case) is not sufficient, thoroughly to sterilize the contents.

In future, buyers of lobsters will be compelled to take into consideration the conditions under which the article is produced, and will grade the prices accordingly. The day when a case of lobsters, regardless of the conditions under which it was packed, had a value equal with one produced under scientific conditions, has passed never to return.

Protection During Breeding Season

I turn now from the question of quality to a second difficulty, namely that of quantity. If the lobster industry is to be a permanent and valuable asset to our country that it should be, it behooves each one of us to consider seriously ways and means of

Year	No. of Traps	Quantity Lobsters	Lbs. per Trap
1920	23,612	3,123 cwt.	27 1/2
1921	32,260	3,522 cwt.	26 1/2
1922	26,611	3,079 cwt.	30 1/2

Pretty Girl: "A man without a country" may be a sad situation, but a country without a man would be worse.

TO PEEL PEACHES.

The task of peeling peaches may be made easier if the fruit is immersed for a minute or a minute and a half in boiling water. Place the peaches in a square of cheese cloth in a flour sack or wire basket or colander and lower them into the boiling water. If well ripened, immerse only one minute. Remove and dip immediately into cold water. Remove as soon as cool and slip the skins off, cut in halves and seed. The same method of peeling may be used for tomatoes.
