FERTILIZER FACTS

In the following table, we make an endeavour to show the plant food content of various Mixed Fertilizers and to indicate the relation in quantities of the materials from which they are made.

Table with 5 columns: Formula, Units Plant Food in one ton, Price per ton ex Factory, Pounds Materials That Will Make One Ton (Ammonia 20%, Super-phosphate 15%, Muriate of Potash 60%), Other Materials (sometimes called filler), Total Pounds.

2-12-6 and 3-15-6 are largely used for sim lar crops — Grain, Hay, Turnips and Pastures. The latter contains more plant food and less "other materials", resulting in a lower cost per unit for the plant food.

4-8-10 and 5-10-10 are largely used for Potatoes. The latter contains more plant food and less "other materials", resulting in a lower cost per unit for the plant food.

4-12-6 is occasionally used for Potatoes. It is a good Grain, Hay and Pasture fertilizer on soils where grass and straw do not thrive.

We manufacture 2-12-6 only for specially placed orders. We make 3-15-6 with 3% Borax at an extra cost of \$3.00 per ton. We make 4-8-10 and 5-10-10 with 1% solution of Magnesium Oxide at an extra cost of \$1.00 per ton.

"Other materials" is usually Limestone, Sand, or a mixture of both. There is a limit to the quantity of Limestone that can be safely added to Mixed Fertilizers. We can make prompt shipment of well cured Mixed Fertilizers, and would suggest your taking delivery as early as possible. THE LABOUR SITUATION IS STILL ACUTE AND WE MAY NOT BE ABLE TO GIVE YOU SATISFACTORY SERVICE IN THE SPRING. The car shortage is also a matter for consideration and may prevent us from making shipments when needed.
