Maritimers Urge Gov't Compile Figures On Inter-Provincial Trade

OTTAWA, June 11 — (OP) — Maritime members urged in the Commons that the Government direct its Bureau of Statistics to compile figures on inter-provincial trade.

Gordon Isnor (L-Halifax) said that in making the survey the Bureau should attempt to determine whether goods manufactured in Ontario and Quebec could be sold at a common price from one end of the country to the other.

D. King Hazen (PC-St. John-Albert) said it was in the interest of the country that inter-provincial statistics on trade be kept.

Charlie Gillis (CCF-Cape Breton South) said statistics were not of much value if the Government did not act on conditions shown by the statistics.

The discussion occurred on a bill bringing the Dominion Bureau of Statistics Act up-to-date.

Mr. Isnor said he felt Ontario and Quebec should be willing to give up some of their prosperity to assist the weak Ontario and Quebec. If goods could be sold at the same laid-down price in all parts of Canada inter-provincial trade would be increased.

Both Mr. Hazen and Mr. Isnor pointed to the fact that a Royal Commission which investigated Maritime grievances had stressed the value of statistics on inter-provincial trade.

Mr. Isnor said the Geneva trade agreement showed that strong countries should make concessions to assist the weak Ontario and Quebec should follow that example. The Maritimes were small, but they made great contributions to Canada. They were entitled to enjoy the same prosperity as Ontario and Quebec.

Mr. Gillis said a Bureau survey

Radial Changes Reported In Contemporary Medicine

MONTREAL, June 11 — Today in medicine it is unwise to take anything for granted, for even in the past 25 years many treatments have changed from one type to another diametrically opposed, Dr. H. M. Elder last night told the Alumnae Association of the Montreal General Hospital School for Nurses at a dinner held in honor of the graduating class at the Ritz-Carlton.

He spoke of the radical change in the introduction of early walking following operation, adding: "Patients who have had half or more of the stomach removed today are hounded out of bed the next day with a resulting diminution of post-operative complications."

Dr. Elder recalled the not-so-distant day when it was routine for a simple appendectomy to be nursed flat in bed for the first week, then allowed a couple of pillows and after 10 to 14 days to be permitted to put foot to the floor.

"By that time," he said, "the muscles of the limbs had atrophied to such an extent that navigating from bed to a chair was quite an adventure."

Noting the tremendous strides in anaesthesia, he said that during the First World War, chloroform was the anaesthetic of choice.

"But who now, other than an enthusiast for euthanasia, rather than anaesthesia, would advocate its use for the ordinary operation in a modern general hospital?"

"There are very many safer means available, and advances are being made constantly so that the surgeon now has an almost embarrassing array from which to choose."

He continued: "Today surgeons can expose and explore, with relative safety, parts of the body which were taboo a few short years ago. 'Pneumonia, the old persons friend,' has now largely lost its terrors."

Speaking of such drugs as sulphonamide, penicillin, and streptomycin, which he said, had practically revolutionized both medicine and surgery, he nevertheless warned that doctors must guard against the attitude of mind extolled by the interne who put patients on sulphas and penicillin and, if they were not better in 48 hours, examined them.

Recalling the days when a blood transfusion was quite a major operation, and the storing of blood unknown, he continued: "Now one orders blood for a patient in much the same manner as one formerly ordered an aspirin."

He noted, too, that in his own interne days, there were no intravenous fluids and no drip apparatus.

"The interne could not then merely insert the needle and leave the nurse to do the rest," he said. "He had to stay to pour the liquid into the burette, open to the air at the top, and raise or lower it in accordance with his ideas of

whether the fluid was running too fast or too slowly."

Coming to war surgery, Dr. Elder underlined the modern conception of taking the surgery to the casualty, not the casualty to the surgery.

"I should be very remiss," he said, "if I did not pay tribute to those very gallant girls who literally fought for the opportunity of going to, at times, most exposed and dangerous positions, sometimes ahead of the Allied guns, often exposed to enemy shell fire, always exposed to bombing, and carrying on there as if in a model operating room in a peacetime general hospital."

In conclusion, Dr. Elder warned his audience that they must let all theories and methods of treatment stand on their own merits, and constantly correlate them with the new discoveries and advancements being made by science.

Supplementary Pasture For Dairy Cows

(Experimental Farms News)

In Eastern Canada permanent pastures and pastures in a crop rotation are usually subject in midsummer to a period of reduced growth due to dry conditions. It is at this time that dairy cows may drop in their milk production, consequently it is advisable to prepare for this expected shortage of feed, says Dr. C.D. Mackenzie, Division of Animal Husbandry, Central Experimental Farm, Ottawa. One way this is done is by making provision for feed after the hay crop is harvested. The seeding of some annual crop or mixture of annuals is often a wise procedure. A crop should be selected which is adapted to the soil and climatic conditions of the district and consideration given to the season of the year in which the pasture is required.

Oats seeded alone not later than June 10 to 15 at 3 bushels per acre may be grazed from 4 to 5 weeks after seeding. The time of seeding may be adjusted to suit the pasture requirement. It is often more desirable to seed oats in a mixture at the rate of 2 bushels plus sudan grass at 20 lb. per acre. This mixture may be seeded about the end of May or early June and the oats will provide early pasture while the sudan grass will provide grazing when the production of oats is considerably reduced. Other mixtures include oats at 2 bushels plus peas at 1 bushel. Millet at 20 to 30 lb. per acre is also suitable for dairy cattle. Corn may be sown to provide supplementary feed, and may be fed as green feed during the pasture season or ensiled in the fall and fed as summer silage the following year.

Control Of Potato Insects With DDT

(Science Service News)

In experimental work and in actual field practice, DDT has proved so effective against potato insects that growers are advised to use this insecticide on their potato crop in preference to any other, says W.G. Matthewman, Division of Entomology, Dominion Department of Agriculture, Ottawa. DDT has given excellent control of the Colorado potato beetle, the potato flea beetle and the potato leafhopper while, particularly in spray form, it has given good results against potato aphids.

On potatoes, DDT should be mixed with a fungicide to control blight. As a spray, it may be combined with bordeaux mixture, with any of the fixed coppers or with the newer, organic fungicides at the rate of one pound of actual DDT to each 100 gallons of liquid. As a dust, it is used in 3 per cent strength combined with a fixed copper and a suitable filler. DDT should not be used in the old copper-lime dust as the lime in this combination greatly reduces the toxicity of the poison.

DDT is available on the market in dust form, with and without fixed copper, completely mixed and ready to use. It may be obtained also in spray form, either as a spray powder or as an emulsifiable liquid, the percentage of the insecticide being indicated on the container.

With DDT preparations, follow the same directions as for calcium arsenate, applying the insecticide as soon as the yellow egg masses of the Colorado potato beetle start hatching. Three applications probably will be sufficient for the latter insect, but to control leafhoppers, flea beetles and blight the

We Produce High Quality CASTINGS!

We make castings in IRON, STEEL and their alloys for contractors, pulp and paper mills, shipbuilders, mining companies and for industry in general.

We also furnish a complete PATTERN SERVICE

A rigid Metallurgical Laboratory control assures top quality castings... We invite your enquiries.
