**BROOKFIELD**—The services in the Brookfield congregation on Sunday, April 23rd, will be as follows: Hartsville, 11 a. m., Brookfield, 7 p. m., Hunter River Sunday School, 2 p. m.

**CLYDE RIVER**—On Sunday, April 23rd, the services in the Presbyterian Church, Clyde River, will be at 3 p. m., Sunday School at 2 p. m.

**FERTILIZER**—Farmers of Albany and vicinity, before placing your fertilizer orders, communicate with the undersigned who has an interesting proposition to offer, J. F. Lord, Albany. 8931-4-17-mwf-31

**POLICE COURT**—At the Police Court yesterday morning a man charged with being drunk and incapable was remanded till Monday. Two men charged with breach of the sanitary by-law, dumping ashes in an improper place, were ordered to remove the ashes.

**SUBSTANTIAL INHERITANCE**—A request has been received by Chief of Police Birtwistle from a legal firm in Boston for information regarding Francis Bambridge or his heirs, for whom there exists a substantial inheritance. Francis Bambridge was known to live in Canada about 1870, probably in this province.

**GENERAL TO VISIT NEW YORK**—Commander Evangeline Booth had hoped to visit London, England, during the next few weeks to discuss with the General national policies and plans rendered advisable by world economic depression, but circumstances seem to make it inadvisable, if not impossible, for the Commander to leave America at the present time. Owing to the urgency of the business referred to, and the necessity for some early decisions upon policies, the General has decided to pay a hurried visit to New York and there discuss with the Commander, and some of her Staff, the problems which are causing them some anxiety. The General has, therefore, arranged to leave London on Wednesday, April 19th, and be back again at International Headquarters on May 6th, and thus be in good time to lead the "Two Days with God" meetings in the Central Hall, Westminster, on May 10th and 11th, for which he is announced.—The War Cry.

**Chinese Students To Be Trained In Great Britain**

LONDON, April 20 — (G. P.) — Technical training of selected Chinese students in Great Britain is to be undertaken through a scheme which has been launched by the Federation of British Industries.

For many years isolated arrangements have been made by a few British Engineering manufacturers to provide training in their works for one or more Chinese students as a means of developing business with China.

It has been felt desirable, however, that these isolated efforts should be co-ordinated and developed, especially in view of the impending industrial development of China, involving increased demand of trained engineers, and the desire on the part of Great Britain to assist in that development as much as possible.

An opportunity for the systematic development of such training facilities was provided by the China Indemnity (Application) Act 1931, which authorized the use of a portion of the remitted China Indemnity Funds for purposes connected with the education of Chinese students.

The object of the scheme which has been evolved is to secure a number of suitable Chinese students each year, in strict relation to the training facilities actually available at works in this country, to supervise such training facilities and, as far as possible, to secure suitable employment for the students on their return to China.

For the present, three scholarships per year will be awarded. Each scholarship will be worth £150 and will be tenable for one year, though the period may be extended. Further, the Federation of British Industries is arranging for passengers from China to be granted at reduced rates and the manufacturers taking part in the scheme are being asked to provide reasonable maintenance allowances.

While the scheme is being initiated on quite a small scale, it is hoped that its success will result in additional grants being made each year, thereby enabling the scheme to be developed and made permanent.

**Ice Patrol To Guard Safety of Ocean Shipping**

ST. JOHN'S, Nfld., April 18—(C. P.)—Every year from about the middle of March until about the first of July icebergs, borne southward by the cold Labrador current, drift into the steamer lanes in the vicinity of the Grand Banks and there menace transatlantic shipping.

The presence of this ice, combined with poor visibility and the prevalence of fog, is a danger which in years past has taken a heavy toll both in human lives and in property damage.

How the ships are guarded today was described here in an address by Floyd M. Soule, senior physical oceanographer of the United States Coast Guard, who is on the General Green, first of the International Ice Patrol ships to come north each year.

"The horrible and spectacular loss of the Titanic which sank shortly after collision with an iceberg on April 14, 1912, so deeply stirred a procrastinating world that an international conference was called and as a result the major maritime nations, on January 20, 1914, signed the Convention on the Safety of Life at Sea which provided for the institution of an International Ice Observation and Ice Patrol Service in the North Atlantic. The United States Government was invited to undertake the operation and management of this service, and through its Coast Guard has conducted this Ice Patrol every year since that time with the exception of 1917 and 1918.

It is on the business of this International service that the General Green is now in these waters. At the present and during the early part of the season her duties are more or less in the nature of reconnaissance, scouting for and locating the southernmost ice, and keeping a watchful eye on its southward drift. As the season progresses the volume of ice increases and its southern limit pushes farther and farther south.

Later on, when the quantity and position of the bergs warrant a continuous patrol of the critical area in the vicinity of the tail of the Grand Banks, that patrol is taken up by two of the larger cutters, one of which is always on duty in the ice-infested waters from the inauguration of the patrol season until the advanced season and the scarcity of ice permits the discontinuance of the patrol.

When the General Green is relieved by the cutter inaugurating the actual patrol, she becomes an oceanographic vessel whose primary duty is to keep the cutter on patrol supplied with an accurate and up-to-date chart of the previously mentioned critical area. These current charts are prepared from oceanographic data which are collected by the General Green at what we call oceanographic stations. At each of these stations, which are well distributed over the area to be charted, it is necessary to determine the vertical distribution of the density of the water from the surface down to a level where the water is motionless.

For the practical purposes of our current charts we need extend our measurements no deeper than 1,000 meters or slightly in excess of 500 fathoms. The density of the water is determined by measuring the temperature and the salinity or saltiness of the water.

In the actual work of the collection of these data at the ocean-

**Ice Patrol To Guard Safety of Ocean Shipping**

ographic stations, we make use of a very ingenious device called a Nansen water bottle. I shall not go into a description of it here, but suffice it to say that it is clamped to a stranded wire cable and lowered over the side of the desired depth and is then tripped. When it is tripped it turns upside down and in doing so closes and traps a sample of water which may then be hauled to the surface, in order that its salinity may be determined. Two thermometers are attached to each water bottle and are themselves ingenious. They are so constructed that when they are kept in an upright position they act as ordinary thermometers, their mercury rising or falling as the temperature increases or decreases; but when they are inverted, they retain the reading that they had at the time when they were inverted. Thus when the water bottle turns over and traps its sample of water, the attached thermometers record the temperature existing at that time and place.

Several such bottles with thermometers are attached to the wire at intervals along its length, so that with a single cast of the wire we collect the desired data from a number of different depths below the surface. Having hauled up the water bottles we then take the samples from them and determine the salinity. This we are equipped to do by either of two methods. One way is by means of chemical filtration and the other is an electrical method in which conductivity of the sample is determined.

Having determined the salinity and temperature at a number of levels from the surface down to motionless water, we can then compute the vertical distribution of density. We can draw an analogy between the atmosphere and the sea. In the former when we have differences in barometric pressure, winds blow, and in the latter, when we have differences in pressure arising from differences in density distribution, currents flow. Taking our 1,000 meter level we say that if the water there is motionless the pressure is everywhere the same. Then if we have differences in density distribution at various geographical points we say that the height of the water column above the motionless plane is different at the different geographical points, and the surface is not perfectly spherical but has relief. We then draw a contour map of the surface connecting all points of equal elevation by a line, and drawing as many lines as are required by differences in elevation. Now this contour map is our current map of the currents following the direction of the contour lines, and the strength or velocity of the currents depending on how close together the contour lines are. The more crowded the lines, the swifter the current.

These current charts are prepared as often as the quantity of ice and the variation of the currents demand. Ordinarily one such current survey will suffice for a month, but conditions may require the construction of a new chart in as short a time as two weeks. The computations involved are somewhat laborious, but the experience of the ice patrol has shown that these charts are of material assistance to the cutters in their work of keeping track of the ice which has drifted into menacing positions in the steamer lanes.

**Aussie Mountie "Gets His Man" In Lengthy Trip**

LONDON, April 20 — (G.P.) — Canada's Royal Mounted Police have rivals in Australia.

The tale of a lone Aussie who followed a trail of 1,300 miles in search of alleged murderers and came back with seven prisoners, reached here from Sydney. Headed a string of six worn camels and followed by seven bearded, manacled natives, Trooper McKinnon of the Central Australian Mounted returned to Alice Springs after being in the desert of Central Australia for nine arduous weeks.

With the returning party were a pair of police trackers who carried two aboriginal heads in kerosene tins, and two native witnesses of the crime. The only clothing of the captives was made of flour bags and twine, given them after their arrest.

The crime came to light last July when a missionary discovered the body of a boy and a man of the Lubra tribe, riddled with spears, 375 miles west of the Alice Springs Station. When Trooper McKinnon set out in early October for his regular patrol of the desolate area he carried instructions to arrest the murderers.

Few clues to aid him, McKinnon travelled west, following native tracks to a waterhole where he encountered an angry tribe of 150 natives. These admittedly had been on their way to exact revenge for

the murders. They were turned back by persuasion of two travelling aboriginal preachers after a boy and the sister of the murdered Lubra, eye-witnesses of the crime, had been recruited for the trial.

Over 100 miles of sandhills, the trooper followed the native boys to the grave of the victims who had been buried by the missionary, who discovered the bodies. The bodies were in a deep hole, covered with bushes, and were much decomposed. Making primitive gas masks of lint and eucalyptus, McKinnon and the trackers recovered the heads and crudely preserved them in kerosene tins.

McKinnon then made southeast, and on an outpost cattle station he arrested Punna, the first alleged murderer. Then, going south, the determined trooper sought Prenty, leader of a gang of cattle killers that had terrorized the natives for years. Following the tracks across the sandhills, McKinnon found Prenty. Five other natives also were arrested.

Handcuffed together, in the heat of mid-summer the suspected natives travelled on foot day after day, hundreds of miles across steaming sands behind the camels. The animals were able to carry only the trooper, his witnesses and aides.

Handcuffed together, in the heat of mid-summer the suspected natives travelled on foot day after day, hundreds of miles across steaming sands behind the camels. The animals were able to carry only the trooper, his witnesses and aides.

Roll call was answered with a "Irish Joke." Minutes of last meeting were read and approved. Reports of committees were heard. It was moved and seconded that Mrs. Alf. MacLean and Mrs. Harry Swag be appointed on the Condo-nance Committee. Next meeting to be held at the home of Mrs. Harry Swag. Roll call to be answered by trying your luck on the "Punch Board." Meeting to be opened by "Polly Wolly Doodle." Meeting closed by repeating the "Creed." A delightful lunch was served.

**MRS. EDITH HAZELWOOD**  
 (Nee Matheson)

Mrs. Edith Hazelwood of Roxbury, Mass., passed to her reward on Sunday, April 9th, 1933.

She leaves to mourn, her three sisters, Mrs. Geo. Moore and Miss H. Matheson of Dorchester, Mass., and Mrs. A. W. McEachern of Charlottetown, P. E. Island, also three nieces and two nephews. Her three sisters were with her at the end.

The funeral services were conducted by Rev. Mr. Brooks, Pastor of Dudley street Baptist Church. During the service Mrs. Harding sang "What a Friend We Have in Jesus."

Services of the Orange Order were conducted by Evangelist Lodge, No 240, L. O. L.

The casket was banked in flowers. Burial was in Mt. Hope Cemetery of West Roxbury.

Mrs. Hazelwood was a daughter of the late John Matheson of Alexandria, La.

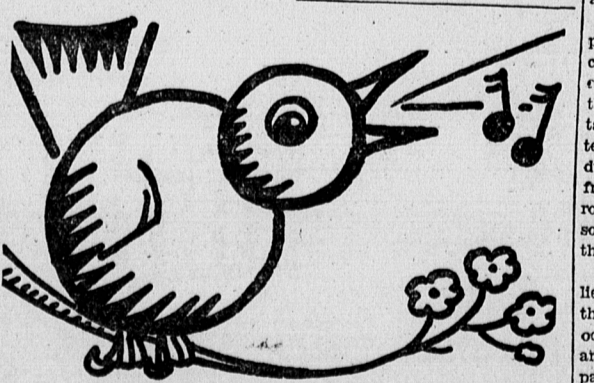

**KISSING EPIDEMIC EXPECTED IN BRITAIN**

LONDON, April 18—An epidemic of kissing is expected in the British Isles over Easter week-end.

Easter-time is kissing time in many parts of England and Ireland, while "heaving" is an additional custom practised in the north of England. On Easter Monday women gently lift men from the ground three times and then demand a kiss.

On Easter Tuesday, the rite is reversed, and the men do the "heaving" and demand the kiss.

At Hungerford, in Berkshire, a man is entitled to claim a kiss from every pretty girl he meets between 12 noon and 6 P. M. He may not always get it.

**welcome Spring**

TOMORROW surprise the family at breakfast with Kellogg's Corn Flakes and sliced bananas. Kellogg's are extra refreshing this time of year. For you are tired of heavy, hot winter foods.

Serve for the children's supper too. Made by Kellogg in London, Ontario.

*Kellogg's for crispness*

**The FORGOTTEN Woman**

● THE NEWSPAPERS have been full of the "Forgotten Man." But how about the "Forgotten Woman"? We don't hear anything of her. She is the woman who apparently lives a 1933 life, but is back with her grandmother in one important respect. She does her housework in out-of-date ways that waste youth, health and time... Yet it is not because there are no easy means for making housekeeping simple and pleasant. For instance, an Electric Range even does away with the necessity of staying in the kitchen while dinner cooks. Automatic controls measure cooking time and heat more accurately than the most exacting housewife. And other improvements, too, help you prepare meals of old-fashioned goodness with new-fashioned ease... For further information just see us or ANY DEALER.
