New York Stocks In Sharp Upswing

NEW YORK, Dec. 21.—(AP)—The stock market Saturday emerged from another recovery week with a fast upswing although strength was selective and many pivots exhibited rising reluctance. Touching 1947 highs Saturday, Amtrada Petroleum, which finished up 4 to 100; Bethlehem Steel up 1 5/8 at 105; Ohio Oil up 1 5/8 at 33 3/8; Texas Gulf Producing up 7/8 at 22 3/8 and Chicago Corp. up 3/8 at 12 1/4. Ahead a point or more were Skelly Oil at 108 1/2; Pacific Western Oil 54 3/8; Youngstown Sheet 70; Nickel Plate Railway 47 1/2; Santa Fe 60; Southern Pacific 48 3/4; Southern Railway 40; Great Northern Railway 39 3/4; Union Pacific 157 1/2; Standard Oil (NJ) 78 1/2; Chrysler 64 1/8; Studebaker 21 1/2; Allied Chemical 187 1/2; and Douglas Aircraft 49 7/8. On the day's losing end were Woolworth, Spiegel, International Harvester, International Nickel, American Can, American Tobacco, B. N. Y. Central and Paramount Pictures. Canadian issues were firm. McIntyre and Hiram Walker gained 1-2 point, Dome Mines 3-8 and Canadian Pacific 1-8. On the curb, Lake Shore was off 1-8. The Associated Press 60-stock composite was up 8 of a point at 65 1/4. It was a high since Nov. 21. On the week the gain was 1.3 points.

WORLD'S LONGEST CANAL

The longest canal in the world is in China, completed in 1350 after 600 years spent in its construction. It is 2,100 miles long.

U. S. Motor Vehicle Output Near Record

CLEVELAND, Dec. 21.—(AP)—Largely as a result of a last-minute spurt by Chrysler Corp., the automobile industry will cross the 5,000,000 car figure in 1947, the magazine Steel reported today. It will be the fourth year in the industry's history when more than 5,000,000 cars and trucks were turned out, and the first since 1941. The trade publication said that meanwhile "strenuous efforts continue to increase flow of iron and steel into consuming plants. Would be buyers of small steel plants are finding that there are no more mills available, that even if they could locate a mill for sale, there is an extremely tight situation in semi-finished material. Furthermore, deliveries on rolling mill equipment now run 15 to 18 months ahead, so revamping existing mills seems to be out of the question."

Seed For Export Not Plentiful

With generally reduced production of the 1947 principal field crops, it is not expected that the quantities of registered and certified seed available for export will be as large as those of the 1946 crop, the Dominion Department of Agriculture has announced. Export permit applications already received for this class of seed, indicate a desire to export quantities far in excess of the surplus likely to be available. A preliminary export surplus of common spring wheat has been established to permit some trading, the final quantity which will be approved for export is not likely to exceed that of last year, about 900,000 bushels. It is not yet possible to establish even a preliminary figure for the export of oats, barley, and flax seed, the Department said. It is essential that farmers in Canada be given every opportunity to obtain seed for their 1948 plantings, and as there are local shortages, farmers using registered or certified seed are urged to arrange for their supplies as soon as possible. Seed processors intending to purchase seed to leave the seed, oats, barley, and flax, eligible on the basis of crop inspection for registration of certification should make certain that the seed is clean plus to local and adjacent domestic requirements before moving substantial amounts from production areas so as to leave the seed, where it is required. This would obviate the possible need for redistribution throughout Canada at higher handling costs, and seed which had been assembled on the assumption that export permits would be granted. The Department points out that the object of the export permit system is to assure that sufficient seed is retained in Canada for domestic requirements. It cannot regulate the quantity of seed retained in any particular province or locality. It is through the co-operation of farmers and seed processors that this can be done to the best advantage of all and with the least cost for second-handling.

How New Varieties Fruits Are Bred

In breeding new fruits the procedure followed is actually simple, says R. C. Palmer, superintendent, Dominion Experimental Station, Summerland, B. C. It consists essentially of transferring the pollen from blossoms of a variety to the stigma in the blossoms of the variety to be used as the female parent. When the resulting seed, matured, cool, and dried, is the seed of some fruits such as apples, pears, peaches and cherries require a period of several months under damp, cool conditions to ripening process. Such seeds are stratified in damp sand or peat, and are held at temperatures just above freezing for several months before planting. Eventually the seedlings are set out in rows and raised to fruiting age. The technique of producing and raising fruit seedlings requires care and strict attention to detail, but the really difficult part of fruit breeding is the choice of the right parents and the selection of seedlings of exceptional merit. When fruit was grown largely in backyards and home orchards, the primary requirements in a variety were vigor and hardiness of plant together with high quality and heavy yield of fruit. Nowadays, when fruits are shipped many miles to market, it is essential that varieties have the handling characteristics necessary to withstand modern methods of grading, packing, shipment and storage. Thus it is not surprising that the plant breeder usually has to raise thousands of seedlings in order to secure one which meets modern marketing requirements. Although fruit breeding work has been in progress at the Experimental Station, Summerland, for many years, only a few new fruits have been named and introduced. These include the Spartan and Jubilee apples, the Van cherry, the Spotlight peach, and the Reliable apricot. In addition, ability and desirable habits of growth, these varieties produce fruit better to handle, which should make them popular on consuming markets near and far.

Selected Crops Visited By Bees

In addition to the production of honey and beeswax, honeybees play an important role in seed setting of legumes, vegetables and fruits. The behaviour of the foraging bee, in communicating the presence of a source of nectar and pollen to the other bees in the hive, has been fairly well established. The bee not only communicates the fact that food is available, but also the scent associated with it. Theoretically it is possible to make a greater number of bees visit any crop that may be selected, by feeding in the hive a concentrated sugar syrup containing the scent of the flowers of the particular crop. The application of this theory was investigated by the Bee Division, Central Experimental Farm, Ottawa, by attempting to train bees to forage on red clover plants. A block of red clover situated within easy flying range of an apiary which contained both Italian and Caucasian bees was visited for two days after the initial training. The results showed a significant increase in the number of both races visiting the plots were continued to those in the initial training. On the third and fourth day of the experiment the Caucasian colonies only visited the plots. Thirteen plots were staked off in the clover field and counts were made of the number of both races of bees visiting the plots for two days prior to the training treatment. On the third and fourth day of the experiment the Caucasian colonies only visited the plots. Thirteen plots were staked off in the clover field and counts were made of the number of both races of bees visiting the plots for two days prior to the training treatment. On the third and fourth day of the experiment the Caucasian colonies only visited the plots. Thirteen plots were staked off in the clover field and counts were made of the number of both races of bees visiting the plots for two days prior to the training treatment. On the third and fourth day of the experiment the Caucasian colonies only visited the plots.

To Prevent Colds, Roup In Poultry

During the fall and winter months colds and roup frequently occur in poultry flocks. Partly matured pullets appear to be more susceptible than older hens. The first symptoms are usually a watery discharge from the nose and eyes. The birds sneeze and throw up their heads in an effort to clear the nasal passages. In advanced cases the breathing apparatus may become affected, or a puffiness or swelling may develop about the eyes. The eye itself usually becomes closed by the swelling. Though the disease is caused by one or more specific germs, it is thought that birds which are not on a well-balanced diet may be more susceptible. It is believed particularly that a deficiency in vitamin A may be partly responsible. This vitamin is found in succulent greenfeed and fish oil. Birds showing advanced symptoms of the disease should be isolated. Treat the flock by spraying at night with the following mixture: 4 ounces Listerine; 2 ounces Eucalyptus; 1 ounce Spirit of Camphor; 2 quarts Coal Oil. Continue spraying every night until the trouble clears up. In the cavity give good results. The pus is removed as described and 15 to 20 drops are placed in the cavity. A veterinary syringe similar to that used for treating horses for Encephalomyelitis can also be used. Insert the needle into the lower portion of the cavity and draw back the plunger. This will remove the pus. The syringe should be removed from the needle, leaving the needle in place. The syringe should then be washed out and filled with 4 per cent silver nitrate, or 15 per cent argyrol. One cubic centimeter should then be injected into the sinus cavity. Treatment in the early stages is essential. This treatment may also be effective with chickens. Birds which have developed the swelling on the face or which have had a serious attack, should be fattened and marketed as soon as recovered, as they may become carriers. To improve the general health of the birds, fish oil should be fed. This can be mixed in the dry mash at the rate of one pint per 100 pounds of mash, or it can be fed in warm wet mash at noon each day, four to six table-spoons per 100 birds per day should give the required amount. If the oil is mixed with the mash, it should be rubbed in by hand until thoroughly mixed and free from lumps. Additional information may be secured by writing to the nearest Dominion Experimental Station or Agricultural College.

Trapdoors Stairs Frequent Causes Farm Accidents

Farm accidents and their causes are analysed in a recent report of the Dominion Bureau of Statistics dealing with non-fatal accidents on Canadian farms for the 12 months ended June 1, 1947. It is estimated that there were 37,200 accidents on farm homes, and 30,000 of these were to men. The most frequent injury arose from falls, and the most frequent reason was the existence of open trap-doors and inadequately protected stairs. Injury from falls was more of a hazard to young and old persons than to those in intermediate age groups. On the other hand, injury from cutting and piercing tools and from crushing, which were almost as frequent as injuries from falls, occurred most often among persons between 20 to 44 years of age, and were often sustained while handling agricultural machinery. Miscellaneous accidents totalled 10,000 and a frequent cause was injury from horses. Backfiring of other engines, automobile accidents, and poisonous gas, also figured among the miscellaneous causes. Accidents were most frequent in fields and woodlots where nearly 60 per cent occurred. Barns and outbuildings were the next most common place of accident, followed by accidents off the farm, and lastly by injuries sustained in the developed the swelling on the face or which have had a serious attack, should be fattened and marketed as soon as recovered, as they may become carriers. To improve the general health of the birds, fish oil should be fed. This can be mixed in the dry mash at the rate of one pint per 100 pounds of mash, or it can be fed in warm wet mash at noon each day, four to six table-spoons per 100 birds per day should give the required amount. If the oil is mixed with the mash, it should be rubbed in by hand until thoroughly mixed and free from lumps. Additional information may be secured by writing to the nearest Dominion Experimental Station or Agricultural College.

HOUSE FOR SALE

Seven rooms and bath on main paved highway, 3-4 mile from Charlottetown. Large lot. 12 young fruit trees bearing. Immediate possession if sold before end of this month. Apply:— BELL & MATHIESON

Paris accessories are elegant trifles. The current season in Paris is marked by a vogue for elegant trifles. Tiny hats of grey pearls, silver or gold, delicate lace jabots and necklaces of black velvet ribbon strewn with spangles or diamonds, jet-colored pearls or gold cord-are used to complete dress-up fashions. Novelty gloves and bags

SPAWN ONLY ONCE Salmon frequenting the waters off the Pacific coast spawn once, and then die, but those in the Atlantic waters spawn several times.

RAW FURS I will pay a special high price for mink caught in December. All other furs full value. It is unlawful to have beaver skins. Bring or send your furs to J. D. JENKINS care of The Royal Packing Co.

DRESSED POULTRY We want heavy dressed Chicken and Fowl, and are paying the top price. Get in touch with us before selling. THE ROYAL PACKING CO. J. D. JENKINS (Prop.)

A gathering of Arab youth at Lifta village, near Jerusalem, is addressed by Abou Saoud, who leads for volunteers in the threatened holy war against the partition of Palestine. Seated at table is Kemal Drekhat, leader of the Arab youth organization. Military leaders of the Arab League are reported to have met in Cairo to draw up "battle plans" for the holy war, which would start when the British depart.
