Mr. Martin and Mr. Black of the well-known firm of Vere Beck & Son, Montague passed through Kilmuir on the 19th of June, on their way to Point Prim cemetery, to cut inscriptions of the late J. S. Murchison and his wife Annie S. Ling on the monument in said cemetery.

ST. MARGARETS TEA - This picnic was by no means a failure though the rain stopped its progress on the first day and the rain also on the morning on the second day. The handsome sum of \$1,150 was realized in toto. Though the crowd was not large it spent freely.

TRINITY CHURCH - There will be a celebration of "The Holy Communion" in Trinity Church, Georgetown, at 11 o'clock, the 9th Sunday after Trinity, (July 29th), Sunday School and Bible Class 2:30 p. m. Evening 7 p. m. Rev. E. Malone, M. A. Incumbent of St. Peter's Cathedral, Charlottetown, officiating.

PUTTING EGGS AWAY FOR WINTER Mary had a little hen; 'Twas feminine and queer, it laid like smoke when eggs were cheap, but stopped when they were dear.

Every old hen on the place is laying at this season provided she can lay at all, and provided further that she is not in the hatching notion. Some of the hens had been on a vacation since last October, but the warm sunshine of April and May, th bugs and worms and green pickings have brought them back into the laying notion with the result that eggs are plentiful.

Now is a good time to put away eggs for next winter. Two methods of preserving eggs are recommended—the use of waterglass, and the lime-water method.

The eggs to be preserved must be strictly fresh. This of course, is very important. The waterglass or sodium silicate may be bought at almost any drug store. Use 1 quart of sodium silicate to 9 quarts of water that has been boiled and cooled. Place the mixture in a 5-gallon crock or jar. This will be sufficient to preserve 15 dozen eggs; the quantity needed to preserve a larger number of eggs will be in proportion.

First select a 5-gallon crock and clean it thoroughly, after which it should be scalded and allowed to dry. Second, heat a quantity of water to the boiling point and allow it to cool.

Third, when cool, measure out 9 quarts of water, place it in the crock, and add 1 quart of sodium silicate, stirring the mixture thoroughly. Fourth, place the eggs in the solution. Be very careful to allow at least 2 inches of the solution to cover the eggs.

Fifth, place the crock containing the preserved eggs in a cool, dry place, well covered to prevent evaporation. Waxed paper covered over and tied around the top of the crock will answer this purpose.

When waterglass cannot be obtained the lime-water method may be used in its stead. Many consider this method satisfactory, although instances are known in which eggs so preserved have tasted slightly of lime.

Dissolve 2 or 3 pounds of un-slaked lime in 5 gallons of water that has previously been boiled and allowed to cool, and let the mixture stand until the lime settles and the liquid is clear. Place clean, fresh eggs in a clean earthenware jug or keik and pour the clear lime-water into the vessel until the eggs are covered. At least 2 inches of the solution should cover the top layer of eggs.

Sometimes a pound of salt is used with the lime, but experience has shown that in general the lime without salt is more satisfactory.

used with the lime, but experience has shown that in general the lime without salt is more satisfactory.

Some people are proud because they wear large size hats and opponents of Women's Suffrage have argued that men are clever because the average male head is larger than the female. But the average lunatic has a larger head still.

The thinking part of the brain is over the eyes. Size there means more intellect than development in the back of the head. A boy's head and brain are commonly believed to stop growing at nineteen, but an expert has discovered that men's heads are a quarter of an inch wider all round than boys' heads, and that between the ages of seven and fifteen years the head grows one inch in circumference.

Some of our greatest men have had large heads but quite as many have possessed small ones. Lord Byron, Captain Cook, George Washington—men of different talents, but undoubtedly all geniuses in their way—belonged to the latter class. The heaviest brain weighed seventy ounces, and yet it belonged to a man who committed two murders and hanged.

Passenger—Conductor, is this a fastest on the line. Conductor—Yes, sir, one of the fastest train? Passenger—Let me out so I can see what it is fastened to.

SORE SHOULDERS ON HORSES!

Minard's quickly heals sore shoulders, saddle boils and all sprains and bruises.

It has been found that when shrinkage takes place there is over-fermentation in the sila, with resultant musty silage. At the Station it is usual to keep a light stream of water in the blower, and excellent results have always been obtained, but care must be exercised as too much water will cause them through the winter in good shape.

Major-Gen. Lord Lovat, Chairman of the British Empire forestry commission, is visiting Canada, with other forestry experts.

A TREAT Sandy had just met his girl at the end of the street, where she was waiting for him. She was looking into a confectioner's window when Sandy made his presence known by remarking: "Weel, Jennie, what are y' gawn to have the night?"

THE GROWING OF O. P. V SILAGE

(Experimental Farms Note) If mixed farming is to be followed in Northern Ontario, and the keeping of live stock to build up the fertility of the soil a cheap and succulent feed must be available to bring them through the winter. Up to the present time it has been found at the Kapuskasing Station that O.P. V. is one of the best feeds for this purpose, although greater tonnage has been obtained from sunflowers, and at a much less cost of production.

The O. P. V. has its advantages over sunflowers; as it can be sown at a much later date, requires no intertilling, is a much more satisfactory crop to handle under field conditions, can be cut by the bin-full size sheaf as it can be harvested and the blower will handle the full size sheaf from the wagon, where it can be fed to the blower as fast as it can be taken care of.

When it is cut at the proper stage for silage purposes it makes a very succulent feed and is readily eaten by stock of all kinds. When the oats are at the dough stage, and the peas well formed, is the proper time to cut and ensile, right from the binder if possible.

It has been found that when shrinkage takes place there is over-fermentation in the sila, with resultant musty silage. At the Station it is usual to keep a light stream of water in the blower, and excellent results have always been obtained, but care must be exercised as too much water will cause them through the winter in good shape.
