MARCONI'S LATEST

Successfully Synchronized
His Message.

LLOYD S. S. COMPANY

Are Having a System Installed at Beikum for Their Fleets.

At the annual gathering of the British Association for the advancement of Science, in 1899, Prof. Fleming of University College, London, addressing the gathering upon Wireless Telegraphy, and incidentally mentioned that while transmitting messages from Boulogne to Dover they were read at Chelmsford some 118 miles from the point of transmission. This, undoubtedly, was a remarkable performance, but it also emphasized very forcibly one drawback which has been long occupied the unremitting attention of Marconi. That is, the possibility of one or more stations reading a message intended for another. Such a circumstance naturally destroys the privacy of the message, and although it is not a very significant matter in the ordinary way; yet it would be a very serious drawback, in case of war, for one belligerent to be able to intercept and to read a message that was being transmitted between the vessels of the other belligerent. Marconi quickly realizes the serious nature of this disadvantage, and at his station at Poole, in Dorsetshire, England, he has been endeavoring for a long time past to successfully synchronize his messages—that is, to construct a transmitter, the message sent from which can be only received by the apparatus which has been turned to receive it.

He has successfully solved the problem, by means of variable conductors and capacities, by the use of which certain instruments can only receive certain messages. By his latest system, Marconi can despatch from a certain point any number of messages, and each message will be received only by that receiver that has been synchronized to the transmitter, so that jamming of words and confusion of messages upon the various receivers are obviated.

Marconi has set up his station at Poole, because that place is so remote and he is safe from interruption. Twenty odd miles away across the Solent is another station at the southwestern corner of the Isle of Wight. Between these two points messages are being transmitted throughout the day, almost without cessation, and this is how several important discoveries and improvements have been made by the inventor. While experimenting with his synchronizing system, Marconi had several opportunities of proving the capabilities of the device. At Portsmouth the English Admiralty were carrying out experiments with wireless telegraphy in connection with the fleet, and naturally several of these ether waves crossed Marconi's line of transmission between Poole and the Isle of Wight, the effects of which upon his instruments the inventor regarded with the utmost satisfaction, since they proved that he had finally surmounted the most perplexing disadvantage of his system. Marconi has also made some other important discoveries. He now utilizes cylindrical tin cans, about five feet in height, in lieu of the vertical wires, since they furnish more convenient capacities

and radiators. He is lengthening the distance over which messages may be transmitted, and although his experiments at Poole can be conducted only on a limited scale, yet he is confident that when he works upon a larger station, they will be equally successful, and the doubt that many important developments in ether telegraphy will be divulged in near future.

At the present moment Marconi has a sufficiency of work on hand. The North German Lloyd Steamship Company are having one of his systems installed at Berkum (Germany), to be used in connection with their fleet of vessels. Apropos of this, Marconi has been carrying out many experiments with a view to applying the system practically to shipping, so that greater safety may be assured to vessels at sea. Then the International Company of France are having the coast of that country, metaphorically speaking, lined with his installations, so that communication may be maintained between the vessels of the French Navy and any point of the mainland, which would play an important part in case of a war between England and France, since by this means the latter nation could manipulate their troops according to the information received from their battleships, and thus be able to work the land and sea forces hand in hand. Then six stations are being set up in the Hawaiian Islands and will soon be in working order. Many vessels in the English Navy are also having the system installed.

Harvest Hands Wanted.

TORONTO, Sept. 8.—Mr. James Hartney, manager of the Manitoba Immigration Office here, received the following message yesterday from Hon. John A. Davidson, Minister of Agriculture for Manitoba:—"Several hundred harvest and threshing hands wanted." This would indicate that the outlook for the harvest in the Prairie Province is better than had been at first anticipated.

DR. PIERCE'S GOLDEN MEDICAL DISCOVERY

THE BEST MUSCLE BUILDER AND BLOOD MAKER

GIVES STRENGTH TO THE STOMACH, PURITY TO THE BLOOD, LIFE TO THE LUNGS.

Child's Strap Slippers,
Sizes: 3, 4, 5
Only 28c.

Hand made—of Black or Tan Pebble leather, leather bound—The greatest thing to wear we know of.

Larger Sizes:
6, 7, 8, 9 and 10
Only 38c.

These sizes have a low flat heel.
Genuine wear resisters for little money.

Alley & Co.
Charlottetown, P. E. I.

Baby's Own Soap

He ran a mile, and so would many a young lady, rather than take a bath without the "Albert"

Baby's Own Soap.

It leaves the skin wonderfully soft and fresh, and its faint fragrance is extremely pleasing.

Beware of imitations!
