**Scientific Miscellany.**

**USE OF DISTANT POWER.**—It has been generally questioned whether power could be conveyed electrically from Lauffen to the Frankfort Exhibition, as was proposed some months ago, and the suggestion has been made that if the project were otherwise practicable leakage would consume the entire current in damp weather. The results, however, have demonstrated the important fact that high tension alternating currents may be successfully, and in many cases economically, transmitted to great distances. On a rainy day 200 horse power has been passed over the line, a distance of nearly 112 miles, with an efficiency of about 75 per cent. The current was raised by transformers to the high potential of 13,000 volts, before passing over the wire, and then reduced by other transformers to a lower voltage before being utilized in the motor.

**PICTURES OF MOVING OBJECTS.**—The photographic analysis of rapid movements has made great progress. In a recent series of instantaneous photographs, Anschutz, of Liess, has secured 24 successive impressions of a dog in the act of making a single jump over a low bush, and each impression is not a mere silhouette, as was the case with Muybridge's first attempts of this kind, but a little picture showing half-tones and detail. Some of the attitudes, never caught by the eye, seem quite amusing. This is true at the commencement of the jump, when the dog's hind toes touch the ground; and at the end of the jump, when his legs are gathered together in a heap.

**LUNAR STREAKS.**—The Astronomer Royal for Scotland states that when the moon is half full its brilliancy is not nearly one-half as great as when it is quite full. He attributes the brightness of the full moon to the bright streaks which are then seen over the lunar surface, starting from the craters. He supposes these to be convex or concave, and largely invisible under cross light and brightly illuminated when the sun shines full upon them.

The electric motor is said to have now found a use in connection with nearly 300 branches of productive industry.

**PICOT'S FLUID.**—Solid carbonic acid has long been used for producing great cold, and has been rendered more effective by mixing with ether. A more manageable compound has lately been made by M. Raoul Picot by liquefying a mixture of carbonic and sulphurous acids by cold and pressure, the resulting fluid giving, by its rapid volatilization, an extremely low temperature. Nitrous oxide is readily liquefied by the cold from this so-called "Picot's fluid," aided by a mechanical pressure of 4 to 10 or 12 atmospheres. The use of the liquid nitrous oxide gives a still more intense cold and, under pressures of 150 to 200 atmospheres, hydrogen, oxygen, nitrogen and common air are rendered fluid. The fluid air, with a temperature not far from 300 deg. below zero Fahr., has a blue color, and forms a quickly-disappearing blue cloud if allowed to escape into the open atmosphere.

**PRESERVING POTATOES.**—A prize of 1000 francs was not long ago offered by a French association for a method of keeping potatoes and other vegetables. Some isolating substance, such as wood ashes, sawdust or rye straw with sand, was used four of the five competitors. The plan of M. Schribaux, who gained the prize, is to put the potatoes for 10 hours in a 1 1/2 per cent. solution of commercial sulphuric acid, when, after being thoroughly dried, they will keep without alteration more than a year. The same solution may be used many times.

A new meat extract, called "Oxin," is prepared in France, and made into tablets, which are said to be as digestible as raw meat. Lean beef, free from fat, bone and tendon, is pounded to a pulp, mixed with sugar, and heated to about 100 deg. Fahr., when the mixture is converted into a saccharine extract. Further heating gives any desired degree of concentration. Consumption has been produced in guinea pigs by inoculation with tubercle bacilli obtained by Her Prausnitz in the dust of cars often used to convey patients from Berlin to Meran. The number of bacilli is supposed to have been small, but the necessity of disinfecting the cars used by the sick is shown.

**AN ELECTRIC ORGAN.**—A musical novelty called the "Electro-magnetic Palisphone," has been brought out in France by Messrs. Guerre and Martin. The sound is produced by a sonorous body, which is vibrated very rapidly by the interrupter of a Ruhmkorff coil. An electro-magnet is placed underneath with the interrupter outside, in such a way that the organ, or sonorous body, vibrates between them and becomes the vehicle of the current. The sound is continuous, resembling that of an organ pipe, and is said to be very pleasing. The arrangement may be used for electric bells, substituting a grave note for the harsh rattling, while it is anticipated that the principle may be applied without difficulty to the production of an electrical organ.

**A NEW ADULTERANT.**—Artificial bitter almonds are now produced at a trifling cost and with such deceptive skill that they can scarcely be detected when used as an adulterant of the genuine. They consist chiefly of grape sugar. This is flavored with a very small quantity of nitro-benzole, and when pressed in molds the product is made to resemble the natural seeds very closely. Dr. M. C. Cooke, of London, finds that 4,800 species of mushrooms and toadstools are now known to science, 1,400 of them being found in the British Isles. Only 134 can safely be regarded as edible, while 30 are decidedly poisonous.

The fourth edition of the Russian Pharmacopolia is soon to be published, and will describe 808 substances used in medicine. In the third edition the number was 1026, of which 318 have been discarded, while 100 have been added. A German substitute for leather in some of its uses consists of thin boards with wiring between the whole glued together

and pressed. The material is tough and pliable, and suited for trunks, etc.

Mr. F. Walter claims that an alloy of 95 per cent. of tin and 5 per cent. of copper will strongly cement glass to metals.

### The Benefit of a Holiday.

August is the month for holidays. The majority of city people whose business permits an annual vacation choose this season of the year for it by almost unanimous selection. At present both the trade and the enjoyment of town life have fallen into the lassitude of summer dullness. But now is the time when the mountains are gayest in verdure, when the surf is most tempting, when the fields and lanes of the country are coolest and the moonlight is most resplendent. After enduring the heat and burden of the day for eleven months in the year, everybody that can wants to get away from paved streets and renew his acquaintance with nature in August.

Each of us enjoys a holiday in his own way, but it would seem that a considerable number of folks do not know how to enjoy it at all. The rural pleasures that tempt such deluded people are the pampering of appetite and the gratification of vanity. They go to the country to eat more than is healthful, to indulge in violent exercise, to display fine clothes or handsome equipments, and often return to town more jaded in body and dispirited in mind than when they left it. But to the prudent man vacation time is a thoughtfully esteemed boon of rest and varying scenes. He enters fully into the pleasures of the fields and forests, to use the exquisite simile of Milton,—

As one who long in populous city pent,  
Where houses thick and sewers annoy the air,  
Forth issuing on a summer's morn, to breathe  
Among the pleasant villages and farms  
Adjoined, from each thing met conceived de-light;

Such a holiday seeker can find sermons in stones, books in running brooks and good in everything, as a greater poet than Milton has said. Even the briefest visit to the country brings mental invigoration as well as physical refreshment. Its repose chastens the bitterness of disappointment over past failures, and lends new hope to our ambition for fresh ventures. We cannot ramble through its quiet woods or recline on the banks of its streams without coming into a broader and more generous humanity. The peacefulness of nature and its simplicity teach us inseparably that struggling, anxiety and ostentation are opposed to the true method of life. In the country we learn to be restful without sloth, reflective without dullness, and idle without enervation. We gain renewed youth and strength, and presently forget the hindrances of life, the sorrows of failure, and the delay of wealth. If nature be received in as kindly a spirit as that in which she offers herself to us, she will not only bring physical healing, but cure also the often fanciful maladies of the mind.

It is a frequent saying of the poets that rural enjoyments are the only things which remain constant and changeless in our esteem. In the city all things are transitory. Our friends find new ties in the multitude of people around them. We are continually moving from one dwelling to another, and the appearance of the town is so perpetually altering, so fatal to innovation or decay that we cannot feel any enduring regard for inanimate objects. But the features of a rustic landscape still seem to us as they were in childhood, permanent and unalterable. The memory that a man has of his native hills, of the brook by which his boyhood was spent, is a sentiment that is always fresh. The woods that were full of chestnuts and birds' nests, the quiet pools in which we angled for perch, the ponds where we learned to swim at an early age, and to skate at another, the path that winds through the meadow to the old church, and the nearby spot wherein lie many of our young companions—are all there, familiar and unchanged. The flight of years has carried us into maturity or old age, leaving these features of the rural scene still fixed and youthful.

But the sentiment awakened by revisiting old places in the country or exploring new ones does no harm to anybody. A holiday taken in this way often brings more health than is declared by brawny muscles and brown cheeks. Nature very frequently puts new happiness into the mind while she is lending fresh vigor to the body.

### Canada's Growth.

(Imperial Federation.)

Politically the growth of Canada towards the dignity and importance of a nation has been equally remarkable with her material advancement. Some people confess to a sense of disappointment in respect to the growth of a national feeling. There is, they say, little indication of the drawing together of East and West in sympathy and aim, and in pride of nationality, which was anticipated in the early days of Confederation. To take this view appears to us unreasonable. All the widely-spread provinces may not as yet feel to the full the sense of their national unity. Twenty-five years is, however, but a short time in the life of a nation, too short to efface the impression of the independent and sometimes antagonistic attitudes assumed towards each other by neighboring but distinct Colonies. As regards East and West, too, it must be remembered that until but a very few years ago they were entirely isolated the one from the other by impassable tracts of forest, prairie, and mountains. The unifying influence of the trans-continental railway is only beginning to be felt. No; we should have said that Canadians were a people peculiarly imbued with national and patriotic feelings; They seem to have in this respect the perverted temperament attributed to the Scotch. They certainly show far more enthusiasm and fervour on national and patriotic questions than their English kinsfolk.

Do you know why Royal Belfast Ginger Ale is the best? Because the Wilmot Spa Mineral Waters are its base, and lime juice and pure extracts are used. All Grocers and Wine Merchants.

See that our Trade Mark—A MARINER'S COMPASS, is on each package.
