By careful planning and saving, this young couple built the house of their dreams with the help of Canada's largest home-lending institution, the Sun Life of Canada. Furthermore, at small additional cost, they wisely protected their investment with a Sun Life Mortgage Protection policy which should the husband die before the home is paid for, instantly clears all remaining mortgage indebtedness.

**Shaw's Body Is Cremated at London**

LONDON, Nov. 7 — (CP)—The body of George Bernard Shaw, unaccompanied by flowers or friends—was carried to a London crematorium Sunday.

But on the lid on his coffin lay a tiny sprig of evergreen—rosemary from the garden of one of his closest friends, the late famed English actress, Ellen Terry.

A little card reading "Rosemary from the Ellen Terry's garden. For remembrance of her partnership with 'Bernie'" rested on the coffin lid as the body was carried by four men from the hearse into the Golden Green crematory chapel.

Shaw's body will be cremated today and his ashes will stand beside those of his wife, Charlotte, until their disposition is decided upon. Dame Ellen Terry died in 1928 at 81. For years she and Shaw carried on a warm "paper courtship" in hundreds of letters.

Today the body, in a grey cloth-covered coffin, was taken from the Welwyn (Hertfordshire) chapel to his home at Ayott St. Lawrence nearby.

Then the hearse and body—without cortege—moved off toward London.

The rosemary was sent by author Christopher St. John, a friend of Shaw's who edited for publication the hundreds of letters in the Shaw-Terry correspondence.

"It put the name of Bernie on it," she told inquiring reporters, "because she always called him by it."

Only a few relatives and close friends will be present at the cremation ceremonies tomorrow. British Sunday newspapers speculated that Shaw would wish of his great fortune toward furthering his plans for a new alphabet of between 40 and 44 letters. The proposed alphabet would have one letter for each sound in the language.

Shaw's will is expected to be offered for probate near the end of the month.

Meanwhile, the Dean of St. Patrick's Cathedral in Dublin, the Republic of Ireland, said he wants Shaw's ashes buried there, alongside another great English-language satirist, Jonathan Swift.

**R. C. A. F. Using New Method To Dodge Storms**

By Dave McIntosh  
 Canadian Press Staff Writer

**EN ROUTE TO TOKYO VIA R. C. A. F. AIRLIFT, Nov. 7 — (CP)—The R. C. A. F. is using a navigator can guide an aircraft around on the weather.**

The method can be used anywhere at any time and is particularly useful when fog and rain fall and clouds blot out the sun or stars.

The method is based on the fact that winds in a low pressure area—that is, bad weather—move counter-clockwise and winds in a high pressure area move clockwise.

In other words, if the plane is flying toward a storm area, it will drift to starboard, or the right. Conversely, when the plane moves toward a high pressure area, it has demonstrated its worth on the R. C. A. F.'s Korean airlift—a shuttle service from McChord Air Force Base, Wash., to Tokyo maintained by the 428 Thunderbird Squadron.

Twelve R. C. A. F. North Stars, with veteran crews from the Second World War, have carried men and equipment via the northern Aleutian route for the Korean war effort, part of Canada's contribution to United Nations forces.

Now let's plunge deeper into this new method of navigation.

When a plane flies from a high pressure area to a low, the pressure altimeter—merely a barometer calibrated in feet—reads higher than the plane actually is (this can be dangerous, of course, when the ground can't be seen).

But a radar altimeter bounces a beam back from the ground or water and gives a true reading of height.

Comparing the two will tell the navigator what kind of weather he's heading into, even without a meteorological forecast before takeoff. If the pressure altimeter reads more than the radar altimeter, then he's headed for a low pressure area.

From this, the navigator determines in which direction he is drifting. But that's not enough. He must know by how much.

Subtracting one reading from the other and applying a factor which varies with altitude, the navigator finds exactly how many miles he is drifting and in which direction.
