Steel Company President Regrets Move From Plant

HAMILTON (CP)—For 40 of his 62 years, Harold M. Griffith has been involved in steel making. Now he has made it to the presidency of Steel Co. of Canada Ltd. but he admits to one regret.
He's afraid the responsibilities of his new post will mean he won't be able to spend as much time in the plant as he has throughout his career.
"I would certainly hate to lose that contact," he said in an interview after his appointment to the presidency last month.
"I feel more comfortable when I am out there in the plant."
It's certain that Mr. Griffith will have to spend a lot of time on top-level decision making, since Stelco is in the midst of the biggest capital expansion program in its 56-year history.
Already Canada's largest steel maker and ninth biggest in North America, Stelco has spent more than \$180,000,000 on expansion during the last two years and has earmarked another \$190,000,000 for further projects.
With production last year of more than 3,800,000 tons and net profit of \$43,450,000, the company's total assets amount to more than \$57,000,000.
TWO MAJOR PROJECTS
The two major thrusts of the current expansion program are both closely connected with Mr. Griffith. One is a new blast furnace, Stelco's fifth and designed as the largest in the western hemisphere, and the company's research centre.
The new furnace, to operate next year, will add more than 4,000 tons a day to the company's capacity.
The \$4,000,000 research centre, to be completed this fall at nearby Burlington, will carry out both pure and applied re-

search in all phases of steel processing.
Both dovetail with the burly Mr. Griffith's belief that a company has to keep looking to the future.
His attitude on this was described by a fellow executive as saving in effect: "Well, we're at this point now but where are we going to be in five years? Let's look and see."
Mr. Griffith was born in 1904 in Clinton, Ill., where his father was a railroad worker. The family moved when he was four to a farm in Missouri. After high school, he enrolled in the Missouri School of Mines, but switched to studying metallurgy and electrical engineering and graduated from the Chicago Institute of Technology in 1926.
He joined Bethlehem Steel Corp. and worked there for four years, before spending six years as a metallurgist with Jones and Laughlin Steel Corp. near Pittsburgh.
GOT A 'THRILL'
"I can remember that first day, being quite thrilled at being attached to the steel industry."
In 1936 he joined Stelco as open hearth metallurgist and worked his way until he was made vice-president of manufacturing in 1953.
Now a naturalized Canadian citizen, he was made executive vice-president two years ago.
The executive shuffle that took Mr. Griffith to the presidency did not break up Stelco's top-level management team.
V. W. Scully, 65, president since 1957 and chief executive officer since 1960, moved up as chairman but retained the chief executive officer role.
H. G. Hilton, 77, president of the company for years before being elected chairman, assumed a newly created position as chairman of the executive committee.

FACTS FOR FARMERS
Well kept lawn is a real asset to any property, either in the city or on the farm. It provides a setting for the home and a base for landscape plantings of trees, shrubs and flowers to make the home surroundings more pleasing.
Careful attention to constructing and seeding lawns is essential. Although increased labour and expense may be involved when establishing a lawn in the proper manner, the maintenance costs of the established lawn will be much less than where the lawn has been constructed hastily and poorly.
Great care should be given to all factors including grading and drainage, soil and seed-bed preparation, liming and fertilizing, kind and quality of seeds and moisture supply.
GRADING AND DRAINAGE
It is advisable that the lawn slope away gradually from the home in all directions. This will usually allow surface water to run off gradually during heavy rains without causing erosion but at the same time allowing sufficient moisture to penetrate into the ground where the grass can use it. It is advisable to avoid terraces and steep slopes if at all possible because they are difficult to mow and do not retain sufficient moisture for good turf growth. No law areas should exist because water or ice lying in these areas will seriously injure the grass.
The topsoil removed in excavating the cellar should be kept in a pile by itself and replaced over the subsoil that is used in grading.— never cover topsoil with subsoil. If the subsoil has been compacted by heavy equipment or traffic, it must be loosened by working up and then leveling before spreading four to five inches of topsoil over it.
SOIL AND SEED-BED
The topsoil should be raked to remove stones and other debris as well as to level out small depressions and mounds. Extra care and effort put into the seed-bed preparation will save work and money during later years.
LIMING
Most of the grasses commonly used for lawns grow well on slightly acid to neutral soils. Lime need not be applied unless the soil is known to be too acid for the satisfactory growth of grass. A soil test will show whether or not lime is necessary and will also indicate the amount of lime to apply if it is required. If lime is used it should be spread evenly and worked into the top 2-4 inches of the soil.
FERTILIZER
Lawn grasses require an application of fertilizer if a satisfactory lawn is to be obtained. Before seeding, work a complete fertilizer — between 20 to 30 lbs. of a 10-10-10 fertilizer per 1000 square feet — into the top two to four inches of the topsoil. This will give new plant seedlings enough food to promote rapid growth and good firm turf the first season. After the lawn is established, it should be fertilized two to four times a year with 10 to 15 lbs. of a 10-10-10 fertilizer per 1000 square feet. The first application should be in early spring before growth begins a second in May or early June to ensure a good turf before high summer temperatures begin and a third or fourth could be applied in late summer or

PROPOSAL SENT IN RUM BOTTLE
LONDON (CP)—A marriage proposal from a bashful Canadian that floated across the Atlantic on its way to the United States has been accepted nearly a year after it was sent, says the British housewife who played the role of cupid.
Alan Hoffman, a student at Dalhousie University in Halifax, took to his pop the question directly, put his proposal in a rum bottle and dropped it from a ship in Hudson Bay.
Eleven months later Elizabeth Singleton, wife of a Birmingham, England, architect, found it on the coast of Cornwall.
She sent it on to its destination — Linda Christiansen, a student at Columbia University in New York.
Monday Mrs. Singleton got letters from Alan and Linda saying they are going to be married.
"How wonderful to find people so romantic," she said. "It has been very exciting playing cupid."
Linda wrote: "I had the surprise of my life when I read your letter and Alan's proposal. I wanted to say yes and flew 500 miles to join him."
Alan wrote: "I was studying the effects of earthquakes during tests on board ship when I dropped the message overboard on June 26, 1965."
"I told Linda I tossed a bottle into the sea last summer. But kept the message to myself. She sent me a telegram from New York saying your letter has arrived. I was so pleased."

EMPLOYMENT
PARTS CLERK REQUIRED

P.E.I. Dept. of Agriculture

early fall to encourage good fall growth.
Special care should be exercised in the purchase of seed for lawns. Only the best No. 1 grade seed should be sown. The use of cheap lawn seed mixtures is poor economy since such mixtures are usually low in germination. A mixture that will fit your lawn conditions should be selected. A seed mixture which should meet most of the general conditions in this area would consist of:
Kentucky Blue Grass, 60 percent; Redtop or Browntop, 15 percent; Perennial Rye grass, 15 percent; White Dutch Clover, 10 percent.
This mixture should be seeded to an approximate rate of four lbs. per 1000 square feet.
After seeding, the soil can be raked lightly to cover the seed to a depth no greater than 1/4 to 1/2 inch. A light dressing of screened topsoil may also be used to cover the seed instead of raking. After the seed is covered the lawn should be rolled and sprinkled.
WATERING
The new seedling should be kept moist but not flooded until the seedlings become well established. A fine spray should be used so that the seed will not be washed out of the soil and the moisture should be allowed to penetrate to a depth of four to five inches. Shallow watering tends to discourage deep rooting. Early morning or evening watering is the best since evaporation is slower than during the heat of the day.
Slopes and terraces should be watered carefully since they dry-out very quickly and the amount of run-off is great. Water should be applied as a very fine spray and allowed to soak in thoroughly.
