

Sour Stomach

Stomach, sometimes called waterbrash, and burning pain, distress, nausea, dyspepsia, are cured by Hood's Sarsaparilla. This it accomplishes because with its wonderful power as a blood purifier, Hood's Sarsaparilla gently tones and strengthens the stomach and digestive organs, invigorates the liver, creates an appetite, gives refreshing sleep, and raises the health tone. In cases of dyspepsia and indigestion it seems to have "a magic touch."
"For over 12 years I suffered from sour stomach with severe pains across my shoulders, and great distress. I had violent nausea which would leave me very weak and faint, difficult to get my breath. These spells came oftener and more severe. I did not receive any lasting benefit from physicians, but found such happy effects from a trial of Hood's Sarsaparilla, that I took several bottles and mean to always keep it in the house. I am now able to do all my own work, which for six years I have been unable to do. My husband and son have also been greatly benefited by Hood's Sarsaparilla—for pains in the back, and after the grip. I gladly recommend this grand blood medicine."
Mrs. FERRIS BURN, Loomister, Mass.

Hood's Sarsaparilla

Is the True Blood Purifier. All druggists \$1.
Hood's Pills cure all Liver and Sick Headache ailments.

PETER THE GREAT.

He Found That It Was the Husband's Cruelty.

There is a story told of Peter the Great in the character of a dentist, which strikes one as very characteristic of his impulsive and high-handed ways. Peter had studied dentistry, in common with most other useful arts, and plumed himself on his dexterity in drawing a tooth, though one finds no record of his giving himself the trouble to stop one. Observing one of his valets in a chamber to be in bad spirits, he asked what was the matter (an unexpected trait in Peter), and was told that it was the spectacle of his wife suffering from toothache that so distressed him. "Why doesn't she have it out?" inquired the Czar, beginning to feel the professional instinct. "I can't persuade her, sire; she always pretends not to suffer when we wish to give her ease, recovers her lamentations (which distress me to hear) when the dentist is dismissed."

"Let me see her," said the Czar. "I'll cure her."

He was introduced to her apartment, and, in spite of her protestations of there being nothing the matter, examined her mouth. Having satisfied himself as to which was the offending molar, the Czar said to her husband: "Hold her head and arms, and she shall be cured in an instant." Then, in spite of the protestations of the whole affair was a trick of the valet to torture his wife, the Czar bent him within an inch of his life—not so much, it was shrewdly suspected, on account of the deception practiced upon him, as because he had caused him to make an incorrect diagnosis—London News.

To Make 150 Miles an Hour.

It is generally conceded that 60 miles an hour is the practical limit of speed on steam railways, as at present constructed. It is rather startling, therefore, to be told that a company has been organized for the purpose of erecting a railway which will bear trains at double this speed. A hundred and twenty miles an hour is a speed, that if maintained would carry one around the world in a trifle over eight days. It is faster than the hurricane, the earlier planes, or anything else that moves upon this mundane sphere. Yet the contrary and the United States Senate for privileges looking to the establishment of a line between New York and Washington, and specifying on the proposed bill that the schedule time shall not be less than 100 miles an hour, which would require a speed of 13 1/2 miles per hour to cover less than stops.

Overcoats, Ulsters, Reefers.

For this time of year you must have one of the three above garments. Call and we will demonstrate to you that our store is the proper place to make your selection for fall and winter.

We carry no old shop-worn stock, our lines are exclusive and newly manufactured, making them the most desirable in the city.

We also show the finest lines of

CHILDREN'S REEFERS AND ULSTERS

In the city, prices ranging from \$1.00 to \$5.00. Make a special visit to the Bargain Corner and we will guarantee to give you the best possible value for your investment.

McKay Woolen Company,

GAS ENGINES FOR MINING SERVICE.

They Represent the Most Economical Power Kept Water.

There can be no question as to the advantages presented by the gas engine for mining work. In many places where mining operations are carried on, fuel adapted for economical use in a steam boiler is scarce and costly. But the use of some of the different forms of gas producers permits us to employ any kind of fuel—coal, wood, refuse, saw brush and the like—which would give but a poor return in the boiler furnace. Moreover, the use of water is required only for cooling the working cylinders, and the quality of the supply is of little moment. Mine water so impure that it could not be used in a boiler will answer all purposes with a gas engine, and where the quantity available is limited it can be economized by using it over and over again.

The gas engine as now constructed is usually a compact machine, requiring less adjustment and less care in its setting up and foundations than the average steam engine; points that may be of moment in a rough mining country. Moreover, there is not the same marked difference in economy between large and small engines as there is in a steam plant; and a small distribute power at various points. It is entirely practicable to use several smaller engines and supply them with gas from a conveniently located producer.

There are other considerations that might be brought forward in favor of the gas engine, but enough has been said to show that it has substantial claims to favor. How much weight these have with practical men is proved by the fact that several of the largest engine builders in the country either have already and some form of gas engine to their lists, or are arranging to do so; appreciating, as they show by this action, the future importance of the motor. The habit here has been rather to look on the gas engine as of use chiefly where small power is needed; but in Europe engines of 200 and 300 horsepower are being introduced. Mills of the largest size are run by these engines coupled, and in most cases with notable economy in fuel consumption. There are no limitations as to size, in fact, than those of convenience of construction and strength of materials, as in the steam engine, and they can be made to furnish any desired power with individual engines of moderate size.—Engineering and Mining Journal.

PRACTICAL USES OF OZONE.

Valuable For Artificially Aging Liquors and Seasoning Wood.

Ozone is now practically applied for these purposes. Experiments with it have shown that it will artificially age brandy, whiskey, sweet and hard wines and liquors. Ozone will also improve coffee by rendering it harmless. Another recent application of ozonized air is that of the thickening of hosiery, which by the liberal use of ozone, which by the old process, took several months. By the liberal use of ozone, the time of the process is reduced to a few days. Most remarkable, however, is the advantage of employing ozone for bleaching linen. The time of the process is less than one-third of the bleaching process by sunlight, not consider-

Highest of all in Leavening Power.—Latest U. S. Gov't Report

Royal Baking Powder

ABSOLUTELY PURE

ing that this latter is dependent both upon the season and the weather. The ozone process of bleaching renders the work absolutely independent of outside influences. Ozone has also been found very valuable in chemical and technical processes, particularly in the production of pure derivatives of starch, for instance, soluble starch, dextrine, crystalline, etc. Here the ozone is instrumental in taking away all the matter which causes the dark color, bad odor and taste.

Gas Made From Wood.

The town of Deseronto, Ontario, where there are several large lumber mills, is partially lighted by gas made from sawdust. The sawdust is charged into retorts which are heated by a wood fire, the gas from the retorts passing into a series of coils and thence into the purifiers, which are similar to those used for coal gas. Lime is the principal purifying agent employed. When it passes out of the retorts the gas possesses an odor much less disagreeable than that of ordinary lighting gas, and resembles somewhat that of the smoke from a fire of green wood or leaves. The works in use are small, turning out daily 540 cubic metres of gas for the production of which about two tons of sawdust are required. A man and boy furnish all the labor needed at the works. The gas in an ordinary burner gives an illumination of about 18 candle-power. The best quality comes from resinous woods. A quantity of 100 kg. of sawdust leaves a residue of 20 kg. of charcoal.

Sleep.

All our senses do not slumber simultaneously, but they fall into a happy state of insensibility, one after another. The eyelids take the lead and obscure sight; the sense of taste is next to lose its susceptibility; then follow smelling, hearing and touch, the last named being the lightest sleeper. The most easily aroused. It is curious that although the sense of smell is one of the first to slumber it is the last to awake. Hearing, after touch, soon ceases to retain consciousness. Certain muscles and parts of the body begin to sleep before others. Commencing with the feet the slumberous influence works its way gradually upward to the center of nervous action.
