Showing at Mt. Stewart Friday - "Wings of Eagles", a story of the Naval Air Arm, starring John Wayne, Don Dailey and Maureen O'Hara.

vacation Bible School

Plans were made recently to conduct a Vacation Bible School in the Dundas United Baptist Church during the last week of July. It is to be a combined effort between the Sunday schools of the United and Baptist churches in the community which includes the surrounding vicinities of Mount Hope, Forrest Hill and Strathcona. Each of the sessions from Monday, July 28 to Friday, August 1, are to begin at 10 o'clock and end at noon. Transportation is to be provided for all interested children. The school is to be under the leadership of two students of the United Baptist Bible Training School and assisted by the pastor of the United Baptist Church. It is hoped that many shall receive a spiritual enrichment from this five-day school.

POTATO FLAKES

Originally potatoes were put in a pot and boiled with their skins on, placed on the table and everyone allowed to peel his own. From that stage, serving potatoes has gone through a variety of changes the latest being the commercial development of what is known as potato flakes. Potato flakes are different from other types of dehydrated mashed potatoes in several respects. They are bulky (about 11 pounds per cubic foot) which is objectionable for military use, but is an advantage in retail merchandising. The flavour of the reconstituted mash is excellent, the short time of drying undoubtedly contributing to the maintenance of a "fresh" flavour. The mash tastes more like that obtained by baking a potato and mashing it then the product obtained by boiling in the usual home method. When reconstituted with three parts boiling water and one part cold milk the texture of the mash is equal to that of a fresh mashed potato. If high solids potatoes are used, the product can be reconstituted with boiling liquids without significant impairment of texture. As mentioned previously, good texture in reconstituted mashed potatoes can be obtained only if the cells remain substantially intact during processing. Potato flake development has stimulated a great deal of interest on the part of potential producers in most of the important growing areas of the United States. It appears now that two companies will be producing in Maine and probably three companies in Idaho next season. This whole subject of potato processing might be summed by saying that it benefits the growers since it affords him an additional outlet for his crop and it increases total potato consumption. Moreover, the public is provided with a nutritious food in stable convenient form. But what about the processor? He can survive only if he makes a profit and to do so the grower must furnish him with a dependable supply of relatively high solids potatoes of varieties well suited to processing. SWEDISH BUTTER Sweden is not generally known as an important agricultural country but nevertheless the disposal of its butter production has become a very real problem. In 1950 production was well over 200 million pounds but by 1957 was under 180 million pounds. In order to improve the situation the following ideas have been advanced. 1. Lower the price of butter from 90 cents to 47 cents and increase that of margarine by 4 1/2 cents a pound. 2. This one is really radical and involves the subsidizing by \$38.60 for each dairy cow slaughtered and 3. The subsidizing of butter used in public institutions. However, Sweden is not the only country with a butter production problem in fact every country which has depended to any extent on export markets is running into difficulty in moving the product and in maintaining prices. HEAVY GRAIN EC Hay-making is in full swing and will continue so to about August 10. At that time attention will start to turn first to Old Home Week and next to the harvest which promises at the moment to be one of the best in many years. In fact some of it may be too good as already some grain fields are lodging even before coming out in head - a condition which very rarely occurs at that stage. POTATO PROSPECTS The stage would appear to be set for heavy potato production in New Brunswick and Prince Edward Island. While official figures on planting are not released yet the impression is generally that there is a marked increase in New Brunswick and that on the Island the acreage may be the largest in many years. Further, ample moisture has produced heavy vines and should conditions remain favourable the yield per acre can also be quite large. The two provinces can look forward to a big job in marketing the potato crop. LIMESTONE One improvement that has taken place during the past 25 years is a marked increase in hay and grass production. A number of factors have contributed to this among these being the use of limestone, better balanced fertilizers and more manure as the result of purchasing western feeds. While nearly every farmer realizes that sour land will not grow good hay and will produce a great variety of weeds yet precautions are not always taken to apply ground limestone which is necessary if the best use of both chemical fertilizers and manure is to be made. Good grass and good hay and good livestock farming depend to a large extent on the consistent use of ground limestone which can be applied at any time of the year. POSITIVE OR NEGATIVE In most matters people may be for, against or neutral. There is, of course, the belief that if you are not for a thing you are against it, an argument which is, of course, not an easy one to settle. So far as the Federation of Agriculture is concerned it is those who were positive in their attitude toward it. So far as giving the organization vitality was concerned those who are against and those who are neutral fall in the same category. There is, of course, this important difference that the neutral person may be persuaded to become active more readily than is the case with the one who is opposed. To get people to say definitely "I will support so and so", and to have them continue this support is not always an easy matter. On the other hand it may be reasonable to assume that the persons involved has been given a fair opportunity to refuse it. This is the basis of a new approach on the part of the Federation to the question of individual membership. In brief, the Federation is taking the attitude that the farmer may be considered a supporter of the Federation until such time as he says that he is not. It is hoped to put the question in this way to some seven thousand patrons of dairy plants in this province. FARM IMPLEMENTS Further protection of the public in respect to purchases of farm implements is provided in amendments to the province's farm implement act in the Saskatchewan legislature. The former act required implement dealers to maintain certain minimum standards and repair equipment on their premises, as well as to maintain adequate supplies of repair parts. The new legislation now requires that each company having dealers in the province must maintain a central establishment in the nature of a branch office of the parent company. This of

Midday Services

The popular preaching of Rev. George W. Goh continues to draw large audiences at the Capitol Theatre each noonday throughout this week. Speaking on the subject yesterday - "Man's Dilemma and Christian Hope", Mr. Goh said there is a breakdown of communications between people between communities and between nations. "They are never just sure that they are getting through to each other - in many cases people are not sure whether they understand themselves."

So far as giving the organization vitality was concerned those who are against and those who are neutral fall in the same category. There is, of course, this important difference that the neutral person may be persuaded to become active more readily than is the case with the one who is opposed. To get people to say definitely "I will support so and so", and to have them continue this support is not always an easy matter. On the other hand it may be reasonable to assume that the persons involved has been given a fair opportunity to refuse it. This is the basis of a new approach on the part of the Federation to the question of individual membership. In brief, the Federation is taking the attitude that the farmer may be considered a supporter of the Federation until such time as he says that he is not. It is hoped to put the question in this way to some seven thousand patrons of dairy plants in this province. FARM IMPLEMENTS Further protection of the public in respect to purchases of farm implements is provided in amendments to the province's farm implement act in the Saskatchewan legislature. The former act required implement dealers to maintain certain minimum standards and repair equipment on their premises, as well as to maintain adequate supplies of repair parts. The new legislation now requires that each company having dealers in the province must maintain a central establishment in the nature of a branch office of the parent company. This of

The popular preaching of Rev. George W. Goh continues to draw large audiences at the Capitol Theatre each noonday throughout this week. Speaking on the subject yesterday - "Man's Dilemma and Christian Hope", Mr. Goh said there is a breakdown of communications between people between communities and between nations. "They are never just sure that they are getting through to each other - in many cases people are not sure whether they understand themselves."

POTATO FLAKES

Originally potatoes were put in a pot and boiled with their skins on, placed on the table and everyone allowed to peel his own. From that stage, serving potatoes has gone through a variety of changes the latest being the commercial development of what is known as potato flakes. Potato flakes are different from other types of dehydrated mashed potatoes in several respects. They are bulky (about 11 pounds per cubic foot) which is objectionable for military use, but is an advantage in retail merchandising. The flavour of the reconstituted mash is excellent, the short time of drying undoubtedly contributing to the maintenance of a "fresh" flavour. The mash tastes more like that obtained by baking a potato and mashing it then the product obtained by boiling in the usual home method. When reconstituted with three parts boiling water and one part cold milk the texture of the mash is equal to that of a fresh mashed potato. If high solids potatoes are used, the product can be reconstituted with boiling liquids without significant impairment of texture. As mentioned previously, good texture in reconstituted mashed potatoes can be obtained only if the cells remain substantially intact during processing. Potato flake development has stimulated a great deal of interest on the part of potential producers in most of the important growing areas of the United States. It appears now that two companies will be producing in Maine and probably three companies in Idaho next season. This whole subject of potato processing might be summed by saying that it benefits the growers since it affords him an additional outlet for his crop and it increases total potato consumption. Moreover, the public is provided with a nutritious food in stable convenient form. But what about the processor? He can survive only if he makes a profit and to do so the grower must furnish him with a dependable supply of relatively high solids potatoes of varieties well suited to processing. SWEDISH BUTTER Sweden is not generally known as an important agricultural country but nevertheless the disposal of its butter production has become a very real problem. In 1950 production was well over 200 million pounds but by 1957 was under 180 million pounds. In order to improve the situation the following ideas have been advanced. 1. Lower the price of butter from 90 cents to 47 cents and increase that of margarine by 4 1/2 cents a pound. 2. This one is really radical and involves the subsidizing by \$38.60 for each dairy cow slaughtered and 3. The subsidizing of butter used in public institutions. However, Sweden is not the only country with a butter production problem in fact every country which has depended to any extent on export markets is running into difficulty in moving the product and in maintaining prices. HEAVY GRAIN EC Hay-making is in full swing and will continue so to about August 10. At that time attention will start to turn first to Old Home Week and next to the harvest which promises at the moment to be one of the best in many years. In fact some of it may be too good as already some grain fields are lodging even before coming out in head - a condition which very rarely occurs at that stage. POTATO PROSPECTS The stage would appear to be set for heavy potato production in New Brunswick and Prince Edward Island. While official figures on planting are not released yet the impression is generally that there is a marked increase in New Brunswick and that on the Island the acreage may be the largest in many years. Further, ample moisture has produced heavy vines and should conditions remain favourable the yield per acre can also be quite large. The two provinces can look forward to a big job in marketing the potato crop. LIMESTONE One improvement that has taken place during the past 25 years is a marked increase in hay and grass production. A number of factors have contributed to this among these being the use of limestone, better balanced fertilizers and more manure as the result of purchasing western feeds. While nearly every farmer realizes that sour land will not grow good hay and will produce a great variety of weeds yet precautions are not always taken to apply ground limestone which is necessary if the best use of both chemical fertilizers and manure is to be made. Good grass and good hay and good livestock farming depend to a large extent on the consistent use of ground limestone which can be applied at any time of the year. POSITIVE OR NEGATIVE In most matters people may be for, against or neutral. There is, of course, the belief that if you are not for a thing you are against it, an argument which is, of course, not an easy one to settle. So far as the Federation of Agriculture is concerned it is those who were positive in their attitude toward it. So far as giving the organization vitality was concerned those who are against and those who are neutral fall in the same category. There is, of course, this important difference that the neutral person may be persuaded to become active more readily than is the case with the one who is opposed.
