CONSERVATION

A WEEKLY COLUMN OF PRACTICAL OPINIONS OF THE VITAL ISSUES AFFECTING THE USES AND ABUSES OF NATURAL RESOURCES BY MR. LUDLOW JENKINS, MARSHFIELD.

It is well known to most of my audience, without doubt, that a valiant effort requiring the help of all of us, is being made, by nature lovers, to salvage at least a remnant of the wildlife that came to us on this continent as a rich heritage.

In this State, in New Jersey and others on two grounds. First, because it defies the purpose for which it is used by capturing them for hawks and owls which only occasionally prey upon birds and rodents and noxious insects.

The English, a nation of sportsmen, have a story of their own. The hunter looks at the blue-pink sky and exclaims "It's a beautiful day—let's go out and kill something!"

The nature waster who coddles his quail, his grouse and his pheasants against the day of the great shoot, by destroying all other wildlife which may now or ever threaten his game, has already waged such unending warfare on what he is pleased to call "VERMIN" that the true conservationist whose interest in the balance of wildlife, now seeks protection for these persecuted species.

And then there is a very vital point to be remembered: Game, as an arbitrary classification of certain species protected or reared for the pleasurable destruction by a small minority of wildlife has been decreed by the courts of the land to belong to all the people.

And then there is a very vital point to be remembered: Game, as an arbitrary classification of certain species protected or reared for the pleasurable destruction by a small minority of wildlife has been decreed by the courts of the land to belong to all the people.

Game is no more interesting nor worthy of pursuit than the other wildlife enjoyed by the great majority. Yet we are confronted by a belligerent determination in certain groups to sacrifice the whole to the maintenance of GAME.

TIMELY NOTES ON TOPICS CONNECTED WITH

Silver Fox Farming

The other day we had an opportunity of a rather lengthy conversation with Mr. Carr, Covehead, and our curiosity prompted us to ask him about how he got and how long it took him to make good.

Like all other fox ranchers I have had my ups and downs—large turnouts some years and smaller ones other years—but taking the blitzer with the sweet I may say that I am mighty glad to be a rancher instead of sticking to my original occupation of farming.

Ray Carr, who lives just a short distance from Ira, caught the silver in your garden that will continue in the summer if you will keep the blooms out when they begin to fade.

Whole Garden Can Be Planted with Pinks

Dainty flowers with a wide range of coloring adaptable for many garden uses are to be found in the many varieties of the pinks. There are so many different pinks that a whole garden could be planted with them alone.

The annual pinks germinate from seed with surprising alacrity, and can be seen peeping above the ground within a week of planting. Pink and red are the predominant colors, and they come in single and double forms.

The Chinese and Japanese strains of double pinks give an amazingly varied collection of colors. New varieties with fringed petals. The single flowering strains have larger flowers, some of them 2 or 3 inches in diameter.

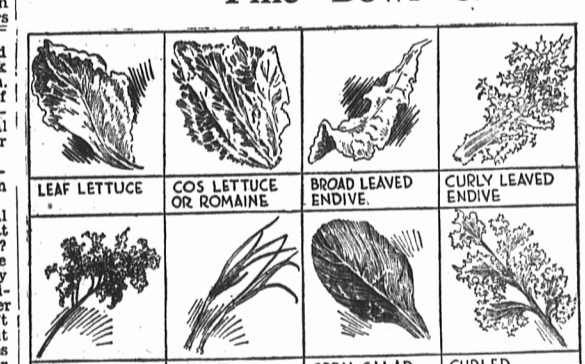

lovely salmon pink flowers cannot be matched by any other plant. The hardy grass pinks are easily grown from seed, and last for many years.

Colpitts Bros. are said to have produced a four absolutely white pups in a litter from a pair of white faced silver foxes but they only lived to be about three weeks old. It would have been most interesting to see how they would turn out if they reached maturity.

The competition between the professional auction companies is so keen that they annually list more

Best Leaf Crops for Fine Bowl Salads

Green Leaves Rich in Vitamin

ins Easily Grown at Home.

Bowl salad, which gourmets of the gay nineties insisted on mixing at the table, and great chefs always include as an indispensable part of a perfect menu, is enjoying a revival and playing the role.

Chervil is an aromatic plant, some what resembling parsley but superior in flavor, and can be used both in the bowl salad and as a garnishment for meats. Like parsley, the seed is slow to germinate.

Here is another point on which the gourmets and doctors agree, since leading chefs in our 9 cities have been insisting upon leaf and stem rather than head lettuce, where they could get it, for mixing their finest salads. Tight heading sorts, they say, lack flavor and do not do justice to carefully blended dressings.

At least two sowings should always be made of these leaf vegetables, one in the spring and one in midsummer for the fall crop, and as many as four sowings may be made with good results.

A most interesting variety of green leaves for bowl salad can be grown by home gardeners throughout the summer and fall. To begin with are leaf and cos lettuce, chervil and the latter romaine. Both are easily grown, leaf lettuce in the early summer and fall, giving leaves large enough to use in thirty days from sowing. Romaine is fully mature in sixty days, and stands the hot weather somewhat better than the leaf type.

Endive is next in importance. It comes in two types, broad and curly leaved. Both have a distinctive flavor. They mature in 70 days and stand both hot weather and frost. A late sowing should always be made to mature in the fall, when frost improves the flavor.

Corn salad has a fresh and spicy flavor which makes it a welcome ingredient of the bowl salad, and is grown easily in spring and midsummer. Curled garden cress thrives in ordinary garden culture and imparts a pungent flavor to the bowl salad. Watercress is highly prized and easily grown where there is a good supply of fresh water to keep it constantly moist.

Results during former seasons shows that the use of Royal with good meat ration is the most positive way known for the rancher to secure best breeding results. Insist on Royal. Ask your dealer today or write direct to
